

What's New in the ER Server/Web Client '4.0.10' Version

This Enterprise Reporter Server software release upgrades version 4.0.05 or higher to 4.0.10. When applying this software update, there will be a momentary impact on filtering and reporting. After the upgrade has been applied, the ER server will be rebooted automatically.

NOTE: *Once this software update is applied, it cannot be undone.*

Enhancements:

- Enhancements were made so that the ER now supports daylight savings time.
- An R3000IR unit's ER now accepts logs from an R3000Mobile device—an R3000 used by the 8e6 Mobile Client application.

NOTE: The reporter within the R3000IR appliance supports a total of 1500 users from both R3000IR and R3000Mobile units combined, so 8e6 will not support issues that arise from exceeding this capacity. The reporter on the R3000IR does not support logs from other standard R3000 appliances.

- The Web Client was enhanced so that the navigational panel at the left of the screen now fully displays all Canned Reports, Drill Down Reports, and Custom Reports topics. In the Drill Down Reports menu section, you can now select any report you wish to view, instead of having the default Categories report automatically generate when accessing Drill Down Reports.
